

SRI FACTSHEET

System of Rice Intensification (SRI) is a climate-smart practice that uses a cultivation system of early establishment, reduced population, use of organic fertilizer and alternate wetting and drying that **reduces the production of methane**

With SRI, the **productivity** of rice can be increased by **50-100%**

SRI Can Also Improve:

- Carbon Finance Projects
- Organic fertiliser production
- Sustainable commercial production
- Water management
- Production of solar powered equipment
- Carbon stock and carbon sequestration of soils

Income can be increased by 98% and GHG emissions from rice fields can be reduced by between 22% and 64%
